

StreamFlix Content Analytics — Management Report

Phase 4: Dashboard & Management Summary — Prepared by Archana Arya

Executive Summary

StreamFlix shows a sizeable and actively used subscriber base, with 15,000 subscribers represented in the final dashboard. The dashboard reports a 25.34% churn rate and a 65.31% average completion rate, indicating that engagement is present while subscriber retention remains an important area to monitor. Viewing activity is concentrated in a few high-performing genres, with Drama generating approximately 0.50M watch hours, followed by Comedy at about 0.42M and Action at about 0.39M. Subscriber activity is also concentrated by device, led by Smart TV at approximately 221K viewing activity, followed by Mobile at 176K and Laptop at 96K. The catalogue contains approximately 7.03K licensed titles and 1.97K original titles, while the dashboard also highlights upcoming licence expiries that require planning. Overall, the results indicate a platform with strong engagement signals, but with clear opportunities to improve retention, content efficiency, and planning around high-value content and licences.

Project Scope

The PRD defines StreamFlix as an SVOD platform operating across 20 countries, with 16 genres, six device types, and three subscription plans. The project dataset contains approximately 979,000 records across six interconnected CSV tables, with viewing history from 2017 through June 2026. The final dashboard follows the required five-page structure: Engagement Overview, Content Performance, Subscriber Insights, Experience, and Catalogue & Investment. The PRD requires each page to include at least two charts, at least one slicer/filter, and a text box containing key insights.

Top 3 Findings

1. Engagement is strongest in a small group of genres and titles.

Drama generates approximately 0.50M watch hours, followed by Comedy at 0.42M and Action at 0.39M. At title level, Gilded Throne leads the displayed top-10 list at approximately 35K watch hours. Completion rates across genres are relatively close, ranging from roughly 65% to 67%, suggesting that differences in total watch time are more closely associated with viewing volume than large differences in completion performance.

2. Subscriber and viewing behaviour is concentrated by plan, season, and device.

Standard has the largest subscriber base at approximately 6.1K, while Basic with Ads and Premium are each around 4.4K. New subscriber acquisition peaks in May at approximately 1.37K before declining in June and July and recovering later in the year. Smart TV records approximately 221K viewing activity, followed by Mobile at 176K and Laptop at 96K.

3. Customer experience signals are broadly positive, while retention still needs attention.

Positive reviews are approximately 75K, compared with about 23K Neutral and 12K Negative reviews. Four-star ratings are the most frequent, at approximately 49K. At the subscriber level, the 25.34% churn rate is below the PRD reference threshold of 30%, while the 65.31% completion rate is above the PRD reference threshold of 60%; both metrics should nevertheless be monitored over time because they directly affect retention and engagement.

Risks Identified

- Retention exposure: 25.34% churn means roughly one in four subscribers in the dashboard population is classified as churned.
- Seasonality: the monthly viewing and acquisition trends show a pronounced May peak followed by a sharp June decline, which can affect release and campaign planning.
- Catalogue dependency: watch time is concentrated in leading genres and titles, increasing the importance of maintaining a healthy pipeline of engaging content.
- Licence exposure: the dashboard includes an upcoming-licence-expiry table, so renewal or replacement decisions need to be planned before expiry dates.

Opportunities

- Use high-watch-time genres such as Drama, Comedy, and Action as anchor categories for content planning and promotion.

- Use device-specific engagement patterns to improve viewing experiences and promotional messaging, especially for Smart TV and Mobile users.
- Use the monthly acquisition pattern to time major content releases, campaigns, and subscriber offers around periods of historically stronger acquisition and viewing.
- Review licensed content through the watch-hours-per-\$1K-spend view before renewal or replacement decisions, while balancing efficiency with strategic content value.

Recommendations

Retention monitoring

Create a recurring retention view that tracks churn by plan, region, tenure, and engagement level. Use it to identify segments where churn is rising and test targeted retention actions.

Content investment

Prioritise deeper analysis of high-watch-time genres and top titles, while using watch-hours-per-\$1K spend as one input when evaluating licensing and production decisions.

Release and campaign planning

Use the observed May engagement and acquisition peak to plan major releases, promotions, and subscriber acquisition campaigns, then monitor whether the seasonal pattern repeats.

Licence planning

Maintain a forward-looking licence calendar and review upcoming expiries early enough to compare renewal cost, watch time, and replacement options.

Dashboard & Analysis Coverage

Dashboard Page	Key analysis included
1. Engagement Overview	Churn rate, completion rate, total subscribers, watch-hours trend, plan filter
2. Content Performance	Watch hours by genre, top 10 titles, completion rate by genre, genre filter
3. Subscriber Insights	New subscribers by month, plan distribution, top countries, region filter
4. Experience	Device breakdown, rating distribution, review sentiment, device filter
5. Catalogue & Investment	Original vs licensed split, watch hours per \$1K spend by genre, upcoming licence expiries, licence-type filter

Submission note: The PRD requires a 2–3 page management report in Word or PDF, with figures traceable to the analysis and no raw data files. Required report name: **Phase4_Report_Archana_Arya**.
